

Set 4: Specialized VIMS processing

1- Start with 2 VIMS cubes of Sinlap Crater, one low incidence angle and one high incidence angle
v1525118253_1.qub and v1492363683_1.qub

2- Ingest, load SPICE kernels and calibrate

```
vims2isis from=v1525118253_1.qub vis=v1525118253_1_vis.cub ir=v1525118253_1_ir.cub
spiceinit from=v1525118253_1_ir.cub
vimscal from=v1525118253_1_ir.cub to=v1525118253_1_ir_iof.cub
```

```
vims2isis from=v1492363683_1.qub vis=v1492363683_1_vis.cub ir=v1492363683_1_ir.cub
spiceinit from=v1492363683_1_ir.cub
vimscal from=v1492363683_1_ir.cub to=v1492363683_1_ir_iof.cub
```

3- Evaluate image geometry with tools such as campt and camstats

```
camstats from=v1525118253_1_ir.cub
    IncidenceMinimum= 0.28125191325474
    IncidenceMaximum= 51.391231318674
    ResolutionMinimum= 19053.824924283 <meters/pixel>
    ResolutionMaximum= 20091.302263223 <meters/pixel>
```

```
camstats from=v1492363683_1_ir.cub
    IncidenceMinimum= 45.857829746984
    IncidenceMaximum= 78.257477423691
    ResolutionMinimum= 34736.850649237 <meters/pixel>
    ResolutionMaximum= 36025.140647579 <meters/pixel>
```

4- Generate averaged methane windows using included perl script: this script averages a series of bands (cubeavg) and computes phase angle, emission angle and incidence angle bands for every pixel (phocube)

Use [vims_mwinavg.pl](#) on the above two cubes; check out .prt and .log files for details of processing

```
./vims_mwinavg.pl -from=v1514302573_1_ir_iof.cub
./vims_mwinavg.pl -from=v1492363683_1_ir_iof.cub
```

This script will generate 11band output files: v1514302573_1_ir_iof_mwinavg.cub & v1492363683_1_ir_iof_mwinavg.cub

5- Map project v1514302573_1_ir_iof_mwinavg.cub to the default sinusoidal projection at 16 pixels/deg

```
cam2map from=v1514302573_1_ir_iof_mwinavg.cub to=v1514302573_1_ir_iof_mwinavg_sinu16.cub pixres=ppd resolution=16
```

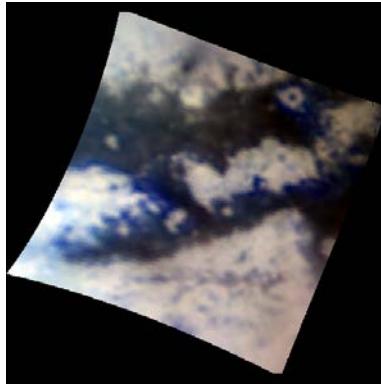

6- Project the 2nd frame to match exactly the cam2map output of step #5 above (v1514302573_1_ir_iof_mwinavg_sinu16.cub)

```
cam2map from=v1492363683_1_ir_iof_mwinavg.cub map=v1514302573_1_ir_iof_mwinavg_sinu16.cub
        to=v1492363683_1_ir_cal_mwinavg_sinu16.cub matchmap=yes
```

Display results:

```
qview v1514302573_1_ir_iof_mwinavg_sinu16.cub v1492363683_1_ir_cal_mwinavg_sinu16.cub
```

For a nice RGB composite: Red=band5 Green=Band4 Blue=Band3

7- For this example, use fx to apply a function on the 5th band of the input cube (+5) and the incidence angle band (+11) to approximately normalize photometric differences between the two observations

```
fx f1=v1525118253_1_ir_iof_mwinavg_sinu16.cub+5 f2=v1525118253_1_ir_iof_mwinavg_sinu16.cub+11 to=v1525118253_B5fx.cub equation=[1.25/cos(rads(f2))]*(f1-0.007)  
fx f1=v1492363683_1_ir_cal_mwinavg_sinu16.cub+5 f2=v1492363683_1_ir_cal_mwinavg_sinu16.cub+11 to=v1492363683_B5fx.cub equation=[1.25/cos(rads(f2))]*(f1-0.007)
```

8- Create mosaics of band5 before fx

- a) cubeatt from=v1525118253_1_ir_iof_mwinavg_sinu16.cub+5 to=beforefx.cub
- b) mapmos from=v1492363683_1_ir_cal_mwinavg_sinu16.cub+5 mosaic=beforefx.cub

9) Create mosaics of band5 after fx

- a) cp v1525118253_B5fx.cub afterfx.cub
- b) mapmos from=v1492363683_B5fx.cub mosaic=afterfx.cub

```
qview beforefx.cub afterfx.cub
```
